## **DETAILED ACTION**

This Office Action is in response to the filing of the application.

### ***Information Disclosure Statement***

The information disclosure statement filed 18 November 2003 fails to comply with 37 CFR 1.98(a)(2), which requires a legible copy of each cited foreign patent document; each non-patent literature publication or that portion which caused it to be listed; and all other information or that portion which caused it to be listed. It has been placed in the application file, but the information referred to therein has not been considered.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-2 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chesebro et al. (U.S. Patent 4,519,128) in view of MacDonald et al. (U.S. Patent 5,770,465).

Chesebro discloses a trench isolation device (Fig. 4) that contains a high concentration collector area of first conductivity type (12), a low concentration collector area of first conductivity type (14) formed on high concentration collector area, a base

area of second conductivity type (18) formed on low concentration collector area and having a trench (36) which penetrates the low concentration collector area in a vertical direction at a junction termination, a high concentration emitter area of first conductivity type (28) formed on predetermined upper surface of the base area, an emitter electrode (54), a base electrode (60) and a collector electrode (56), where the trench is formed of an oxide. (Column 1, lines 20-22) Chesebro discloses all the limitations except for the trench having a depth of 50-100 micrometers. Whereas MacDonald discloses a trench isolation device (Fig. 2m) that contains a trench with a depth of 100 micrometers. The trench is formed of a depth of 100 micrometers to act as high aspect beams. (Column 2, lines 6-8 and Column 6, lines 25-30) Therefore it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the device of Chesebro by incorporating a trench with a depth of 100 micrometers to act as a high aspect beam as taught by MacDonald.
